Current requirements for tailings dam engineers in Alaska

Charles F. Cobb, P. E.
State Dam Safety Engineer
Alaska Department of Natural Resources
Presentation Outline

Current requirements for dam safety engineers in Alaska

Under the Alaska Dam Safety Program
- Alaska dam safety guidelines
- Alaska dam safety statutes and regulations
  - AS 46.17 and 11 AAC 93

Under the Board of Registration for Architects, Engineers, and Land Surveyors
- Alaska Board of Registration guidelines
- Alaska Board of Registration statutes and regulations
  - AS 08.48 and 12 AAC 36

Opinions and recommendations
Alaska Dam Safety Program

The Alaska Dam Safety Program is administered as a cooperative effort between the Alaska Department of Natural Resources (ADNR) and the various persons, businesses, agencies, and other interests that are involved in the design, construction, and operation of dams. To foster cooperation, communication between these parties must be effective and efficient.

Communication is the key to the safety of dams. Design drawings, operation and maintenance manuals, inspection reports, emergency action plans, and other documents are simply methods of communicating important information directly related to the safe design, construction, and operation of dams. Effective, clear communication is necessary to ensure that people involved in dam projects are informed, and that the dam is operated safely.

By anticipating the scope of the communication, all of the entities involved will better understand the level of commitment necessary to accomplish the objectives of a particular project. Safe dams are the ultimate objectives of the Alaska Dam Safety Program. If cooperative relationships can be established between all of the parties involved, the entire community will benefit.

To learn more about the Alaska Dam Safety Program, review the Guidelines for Cooperation with the Alaska Dam Safety Program. (PDF)

For more information or to submit applications for the construction, modification, repair, removal or abandonment of dams, contact:

Mission Statement

The mission of the Alaska Dam Safety Program is to protect life and property in Alaska through the effective collection, evaluation, understanding and sharing of the information necessary to identify, estimate and mitigate the risks created by dams.

Guidelines for Cooperation with the Alaska Dam Safety Program

Chapter 1

WELCOME TO THE ALASKA DAM SAFETY PROGRAM

1.1 Introduction ......................................................................................... 1-1
1.2 Objectives of Guidelines .................................................................... 1-2
1.3 Project Responsibilities ........................................................................ 1-3
  1.3.1 Alaska Department of Natural Resources .................................. 1-3
  1.3.2 Owner of Dam ............................................................................. 1-3
  1.3.3 Operator of Dam .......................................................................... 1-4
  1.3.4 Qualified Engineer ....................................................................... 1-4
  1.3.5 Construction Contractors ......................................................... 1-6
  1.3.6 Emergency Responders .............................................................. 1-7
1.4 Disclaimer .......................................................................................... 1-7
Guidelines for Cooperation with the Alaska Dam Safety Program (excerpts)

• “Within these guidelines, references to the “engineer” are widespread and context dependent. A variety of engineers are referred to and described; examples are “engineer of record” and “construction inspection engineer.” For purposes of these guidelines, references to the engineer assume a qualified engineer as defined by the regulations, within the context of the discussion. Generally speaking, the engineer is responsible for the following:
Guidelines for Cooperation with the Alaska Dam Safety Program (excerpts)

• Maintaining a curriculum vitae that demonstrates relevant experience to meet the qualifications described in 11 AAC 93.193

• Understanding the regulatory setting of a project, the intent of the regulations, and the work necessary to accomplish the desired outcome, without taking shortcuts that circumvent the regulations and compound the risks

• Becoming an “engineer of record” by placing a signature and seal on reports, drawings, specifications, and other engineering work products. [“Sealed” is defined in 11 AAC 93.201(12) to mean “prepared by an engineer or a person under that engineer’s direct supervision, and bearing the signature and seal of that engineer as required by AS 08.48.221 and 12 AAC 36.185.”]

• Recognizing personal limitations and assembling a team of engineers as required to address all of the broad range of engineering disciplines typically associated with a dam, including additional engineers of record to certify details associated with other disciplines such as electrical or structural components

• Locating and designing dams with safety as the primary goal by using technically sound and complete engineering methodology that represents the level of care exercised by professional engineers across the nation…[five more bullets in list]
Alaska dam safety statutes (excerpts)

AS 46.17.020 Administration and Staffing
The department shall supervise the safety of dams and reservoirs. The department shall employ a licensed and qualified engineer, experienced in the design and construction of dams and reservoirs...for performing duties under this section...

AS 46.17.050 Inspections
At least once every five years, the department shall inspect every dam and reservoir... The department may require the owner of a dam or reservoir to conduct the inspection...using a qualified engineer approved by the department...
Alaska dam safety regulations (excerpts)

11 AAC 93.193 Qualified Engineers [3 distinctions]

a) To conduct hazard potential classifications or seal design and construction documents:
   i. 5 years as a licensed civil engineer in the U.S. and registered to practice in Alaska
   ii. Significant work experience with dams

b) To be approved for periodic safety inspections conducted in accordance with 11 AAC 93.159
   i. 5 years as a licensed civil engineer in the U.S. and registered to practice in Alaska
   ii. Sufficient experience to determine safety of dam being inspected

c) To observe and inspect dam construction
   i. Same as first, but not necessarily the same person
ALASKA STATE BOARD OF REGISTRATION FOR ARCHITECTS, ENGINEERS, AND LAND SURVEYORS

Public Notice

- Proposed Regulations Changes

The Alaska State Board of Registration for Architects, Engineers, and Land Surveyors proposes to change regulations by repealing the regulations requiring an application for the fundamentals of engineering and land surveying examinations, updating the requirements for education and experience requirements for examinations, and updating regulations to be in line with the National Council for Architect Registration Boards (NCARB).

Written comments deadline: 4:30 p.m. on January 23, 2017.

AS 08.48.341 Definitions

(3) “engineer” means a professional engineer...

(16) “professional engineer” means a person who has been legally registered as a professional engineer by the board.
"civil engineering" means the branch of professional engineering that embraces studies and activities relating to research, design, and construction of fixed works for irrigation, drainage, waterpower, water supply and treatment, flood control, inland waterways, harbors, municipal improvements, railroads, highways, tunnels, airports and airways, sewerage, refuse disposal, foundations, structures, and bridges, and the organizational and economic aspects of these studies and activities;

"mining and mineral processing engineering" means the branch of professional engineering that embraces studies and activities relating to the exploration, location, and recovery of mineral commodities, and the research, design, construction, and development of structures, devices, and facilities of production, and the organizational and economic aspects related to these studies and activities;
AS 08.48.341 (12) “practice of engineering” means professional service or creative work, the adequate performance of which requires the specialized knowledge of applied mathematics and sciences, dealing with the design of structures, machines, equipment, utilities systems, materials, processes, works, or projects, public or private; the teaching of advanced engineering courses in institutions of higher learning; the direction of or the performance of engineering surveys, consultation, investigation, evaluation, planning, and professional observation of construction of public and private structures, works, or projects and engineering review of drawings and specifications by regulatory agencies; “practice of engineering” may by regulation of the board include architectural building design of minor importance, but it does not include comprehensive architectural services;
• AS 08.48.171 through 265 Registration and Practice
  • Registered professional engineer
    • Seals and certifies documents developed under “direct supervision”
  • Certificate of authorization for corporate, limited liability company or limited liability partnership practice
    • Must designate Alaska registered engineer responsible for field of practice
12 AAC 36.135 Review of application for corporate, LLC, or LLP authorization

- Requires resolution from board of directors designating sector lead registered engineer
- Resolution must provide that engineer with full authority “to make all final practice decisions on behalf of the corporation, LLC, LLP”...
• 12 AAC 185 Use of Seals

(a) A registrant may  

(1) Not sign or seal a drawing or document dealing with professional services in which the registrant is not qualified to sign or seal by virtue of education, experience and registration…

(7) Not sign or seal drawings, documents, or other professional work for which the registrant does not have direct professional knowledge or direct supervisory control …
• 12 AAC 185 Use of Seals
  (b) If portions of drawings, documents, or other professional work are prepared by other registered professionals, a registrant may seal only that portion of the work for which the registrant has direct professional knowledge and direct supervisory control.
• 12 AAC 185 Use of Seals

(c) Each office maintained for the preparation of drawings, specifications, reports, or other professional work that will require a professional seal must have a registrant assigned to and regularly employed in that office who has direct knowledge and supervisory control of that work.
Opinions and recommendations

- National and international initiatives on engineers of records may encounter resistance with state or provincial jurisdictions because of existing statutes and regulations.
- Resistance should not discourage dialogue on subject at state, national and international levels and efforts to improve consistency and regulations across regulatory jurisdictions.
- Alaska dam safety regulations were carefully crafted to avoid conflicts with state license requirements for professional engineers.
- Alaska Dam Safety Program currently advocates team approach to dam safety including mine tailings dams.
  - Presentation on technical team approach to tailings dam design, construction, and operation at Alaska Miners Association annual conference in 2011.
Opinions and recommendations
• Alaska Miners Association 2011 annual conference

How to drive a dam safely and win the race

By Charles F. Cobb, P. E.
Alaska Department of Natural Resources
Dam Safety and Construction Unit

A dam is like a car or truck: It is as safe as the one who drives it. However, if the tires are cheap or the brake lines faulty, even the safest driver is in danger from using the vehicle. Similarly diverse in form and function, a dam is an indispensable tool that provides significant direct benefits, from individuals to society at large, whether it creates a stock pond down on the ranch, or controls floods or produces hydroelectricity. Dams also provide indirect benefits to society as an essential element of mining, when water and tailings storage are critical to the development and operation of the mine. While most mines are in remote locations, where an accident with the dam may not actually kill somebody, the failure or mis-operation of a dam can have major impacts, and fatally injure a mining project. While rare in occurrence, safeguarding against such an event requires careful planning and performance. To avoid a fatal flaw, an interdisciplinary team of highly qualified experts is required to carefully select the appropriate location, and provide for the skilled design, construction, operation and closure of the dam.

A certain wise man once said, “Plans fail for lack of counsel, but with many advisors they succeed.” This proverb is especially true for dams, as a “technical team” approach is required to competently develop the many investigations, evaluations, reports and plans that must come together to assure that the car stays on the road. The horsepower of the technical team comes from qualified professional engineers, engineering geologists, hydrologists, seismologists, tailings specialists, risk managers and other experts, depending on the unique aspects of the project. Figure 1 shows suspected causes of dam failures in the United States and Alaska that the technical team must guard against. Figure 2 shows an international perspective on the threats to tailings dams. Neglect these hazards at your peril!
Un-named Alaska Placer Mine had at least two prior piping failures.

Construction of blanket drain designed by qualified engineer.
Un-named Alaska Dam

Construction complete April 25, 1992
Failed May 25, 1992 due to piping
No fatalities
There have been no unexplained tailings dams failures...every failure has been predictable...

There are no unknown loading causes, no mysterious soil mechanics...

Tailings dam failures often occur where one or more aspects of design and construction/operation are deficient
Tailings Dam Failures: The Human Factor
Al Gipson (2003)

• “[Problems seen] are all areas where we have the technical information to avoid or the management tools to fix. None are rocket science or lessons we have not learned in the past.”

• “Utilizing knowledgeable experienced professionals for policy setting, planning, design, construction and operation of tailing facilities with appropriate internal peer reviews and regulatory oversight by trained and experienced professionals with appropriate levels of funding can lead to the goal of zero failures.”

Applies to everyone in list
When things go right
What the technical team can do...

More to it than meets the eye
High tech horsepower...Yeah, Baby!
The results of thinking ahead
Protecting the Operator (Operations)
Protecting the Public (Environment)
The safety wall

Highly qualified experts

Again, more than meets the eye
Thank you for listening!
